

Listeria Advice for Patients taking Lemtrada (Alemtuzumab)

This leaflet aims to answer your questions about taking Lemtrada (Alemtuzumab) and to reduce your risk of Listeria infection. If you have any questions or concerns, please speak to a doctor or nurse caring for you.

What is Listeria and what is the risk?

Listeria monocytetes (Listeria) is a bacterium that causes an illness called listeriosis. Cases of foodborne illness from Listeria are rare, but can involve serious symptoms and even death in certain groups of people. These include: people with a weakened immune system such as multiple sclerosis, pregnant women and their unborn babies, new-born babies and elderly people.

The types of food in which Listeria can be found

- cooked sliced meats, cured meats, smoked fish, cooked shellfish, blue veined and mould-ripened soft cheeses, pâté, readymade sandwiches and salads.

What you can do to avoid Listeria

To reduce the risk of Listeria when preparing food at home, it is important to:

- keep raw and ready-to-eat foods separate to avoid cross-contamination
- wash fruit and vegetables thoroughly
- keep chilled ready-to-eat foods cold – make sure your refrigerator is working properly and is set to 5⁰C or below
- always use foods by their use-by-date
- follow the storage instructions on the label and use opened foods within two days unless instructions on the packaging say otherwise
- eat ready-to-eat food within four hours of being taken out of the refrigerator
- cook or reheat foods until they are piping hot throughout
- ensure that you follow manufacturer's instructions in the preparation of all foods
- ensure you wash your hands properly before handling food.
