

# Proximal Interphalangeal (PIP) Joint Replacement Surgery and Rehabilitation

This leaflet offers more information about your proximal interphalangeal (PIP) joint replacement surgery and rehabilitation after the operation.

If you have any further questions, please speak to your hand therapist.

## What is PIP joint replacement surgery?

Joint replacement (also called arthroplasty) is used in the hand for many different reasons. This surgery can help to reduce pain, correct deformities and provide increased movement and function.

No joint replacement can ever move as well or be as strong as the joint before. You will need to complete specific exercises regularly after your operation to get your new joint working as well as possible for you.

Your new joint will take about 12 weeks to heal and within this time you must try to get back as much movement as possible.

## Will I need to do any specific exercises?

In the first one to two weeks after your surgery you will be provided with a splint to wear to protect your joint replacement. The splint must be worn at all times and your therapist will let you know when you can stop wearing it.

Your therapist will also give you a separate sheet of exercises which you will need to complete and will show you how to do them.

## What do I need to do after I go home?

Try to keep your arm elevated to keep any swelling to a minimum and lift your arm above your head regularly to keep your shoulders and elbows moving.

Once your wound is fully healed, massage your scar(s) with a non-perfumed cream such as Nivea or E45 cream.

Do not get your hand wet or use your hand for any activities or drive until you are told this is allowed by your hand therapist or surgeon.
