

Tonsillitis in Children

This leaflet provides information about tonsillitis in children. If you have any further questions or concerns, please speak to the staff member in charge of your child's care.

What is tonsillitis and why does my child have it?

Tonsillitis is an inflammation of the tonsils. It is a common childhood illness although teenagers and adults can get it too. It is most commonly caused by a viral infection. Sometimes it can also be caused by a bacterial infection (group A streptococcus infection which is also known to give Scarlet Fever).

The infection may spread by close physical contact with other people or by droplets in the air, caused by sneezing or coughing.

As with coughs, colds, flu and other similar infections, there is a chance that you can pass on the virus or bacteria that has caused tonsillitis.

What are the signs and symptoms of tonsillitis?

Symptoms	Signs
<ul style="list-style-type: none"> • A sore throat is the most common of all tonsillitis symptoms. • Pain on swallowing. • Pain may be referred to the ears. • Small children may complain of abdominal pain. • Headache. • Cough. • Changes in the voice. • High temperature (fever). • Feeling sick. • Feeling tired. 	<ul style="list-style-type: none"> • The tonsils may swell and become red. • Pus may appear as white spots on the tonsils. • Swollen painful glands in your child's neck. This feels like lumps on the side of the neck. • Bad breath.

Symptoms typically get worse over two to three days and then gradually disappear, usually within a week.

Are there any tests needed to confirm the diagnosis of tonsillitis?

No tests are usually needed to confirm the diagnosis of tonsillitis. The diagnosis of tonsillitis is a clinical one made by your doctor.

If there has been an outbreak of group A streptococcus infection in the community and if the doctor reviewing your child thinks s/he may have this infection, a throat swab is often performed and your child might start antibiotics.

How to treat tonsillitis yourself

Tonsillitis usually must run its course.

To help ease the symptoms:

- Make sure your child rests and gets plenty of sleep.
- Encourage your child to drink plenty of cool drinks to soothe the throat.
- A diet of soft foods may help if your child is having difficulty swallowing.
- Give your child paracetamol or ibuprofen. This will help to improve the symptoms of pain and fever.
- A throat spray called 'diflam' can help ease the pain in the throat and help children to swallow fluids.

Antibiotic treatment

If you have not been given a prescription of antibiotics:

- Viral tonsillitis does not respond to antibiotic treatment.
- Antibiotics make little difference to how long symptoms last.
- Withholding antibiotics is unlikely to lead to complications.
- In most cases, we do not give antibiotics as they can eventually lead to antibiotic resistant. Tonsillitis generally improves without the need for antibiotics in healthy, vaccinated children.

If you have been given a prescription of antibiotics:

- A small number of children will require antibiotics to treat their symptoms.
- When antibiotics are given, it is because the doctor or practitioner suspects a bacterial infection.
- It is important that you complete the full course of antibiotics. This is usually for seven days.

If you have been given a delayed prescription of antibiotics:

- Sometimes the doctor or practitioner will feel that antibiotics are currently not needed but may be needed in the next 24-48 hours.
- You should collect the prescription of antibiotics if:
 - Symptoms become worse or

- Symptoms do not respond to simple treatments
- If you are concerned about your child's symptoms you should arrange for your child to be reviewed by your GP.

Complications with tonsillitis

- Complications with tonsillitis are very rare.
- Sometimes you can get a pocket filled with pus (abscess) between your tonsils and the wall of your throat. This is called a quinsy.
- The following symptoms may suggest your child is not responding to treatment or has developed a complication:
 - A severe sore throat that quickly gets worse
 - Swelling inside the mouth and throat
 - Difficulty speaking
 - Difficulty swallowing
 - Difficulty breathing
 - Difficulty opening your mouth.

If your child develops any of these symptoms take them to their GP or go to A&E.

When can my child return to school?

Children may return to school after the fever has resolved and they are no longer feeling unwell.
