

Oedema Management: Retrograde Massage

This leaflet explains retrograde massage. This technique should be used only by patients who do not have lymphoedema or any underlying lymphatic or vascular conditions. If you have any further questions, please speak to the hand therapist involved in your care.

What is oedema and why have I got it?

Oedema is a build-up of excess fluid in the body which causes the affected tissue to become swollen. Oedema in the hand can be caused by a variety of conditions or can occur after an injury or surgery to the fingers or hand. After an injury or surgery, your body's natural response is to send fluid to the affected area as part of the healing process. With some medical conditions, more generalised oedema can occur.

What is retrograde massage?

Retrograde massage is a type of massage technique that can help to disperse oedema and to encourage blood flow in the hand, which aids in reducing oedema. This, in turn, can help to improve movement in the hand.

What can I do?

This should be done for at least _____ minutes, _____ times each day.

1. Rest your hand on a flat surface e.g., table or armrest. If possible, try to have your hand and lower forearm slightly raised – you can do this by using a pillow or cushion. This will assist with allowing the excess fluid to drain away from the hand.
2. To move the oedema away from your hand you will need to 'clear' a path for the oedema. Start (1) by massaging over the wrist area using gentle 'stroking' movements away from the fingers towards the elbow. Each stroke should be performed slowly using gentle pressure only. Complete five to ten movements.
3. Move onto the area on the back of your hand and undertake the same 'stroking' movement, using gentle pressure. Complete this five to ten times.
4. Finally, move onto the fingers and undertake the same 'stroking' movement. Complete this five to ten times.

5. Once you have completed this 'clearing' technique, gently massage (2) your hand from the fingertips to the base of the hand and then move onto the forearm. Each stroke should be done gently and in the same direction. Complete five to ten movements.
6. Once you have completed the massage, try gently bending and straightening your fingers to encourage more oedema to move away from your hand.

Precautions

Care must be taken not to disrupt any delicate skin or new scar tissue by applying pressure too deeply with the fingertips. A water-based cream can be used to help the fingers glide across the surface of the hand more smoothly.

Contact us

If you have any questions regarding the information provided in this leaflet, please feel free to discuss them with your therapist at your next appointment.

For more urgent queries contact us on the **treatment enquiries** telephone number listed below.

Your therapist's name is _____

Treatment enquiries: 020 8725 1038

Appointments: 020 8725 0007

Additional services

Patient Advice and Liaison Service (PALS)

PALS can offer you advice and information when you have comments or concerns about our services or care. You can contact the PALS team on the advisory telephone line Monday, Tuesday, Thursday and Friday from 2pm to 5pm.

A Walk-in service is available:

Monday, Tuesday and Thursday between 10am and 4pm
Friday between 10am and 2pm.

Please contact PALS in advance to check if there are any changes to opening times.

The Walk-in and Advisory telephone services are closed on Wednesdays.

PALS is based within the hospital in the ground floor main corridor between Grosvenor and Lanesborough wings.
