

Congenital Clasped Thumb in Children

This leaflet provides information about the hand therapy treatment available for children with congenital clasped thumb. If you have any further questions or concerns, please speak to the staff member in charge of your child's care.

What is congenital clasped thumb and why has my child got it?

Congenital clasped thumb is also known as thumb-in-palm. It describes the position of the thumb being fixed in a bent position across the palm of the hand and that the thumb can only be straightened using another hand, i.e. the child cannot straighten the thumb using their own muscles.

It occurs due to either a weakness or an absence of the tendon-muscle units that straighten the thumb. It is often seen in both hands.

It is still not clear why it occurs and is usually random, however it can sometimes be associated with syndromes.

What are the signs and symptoms?

At birth it is common for the thumb to be bent across the palm and babies will often continue to hold their thumb in this position for many months. If it does not gradually release and open up over the first three to four months of their life, then it may be due to congenital clasped thumb.

It is also common for the skin between the thumb and index finger to be tight in congenital clasped thumb, making it difficult to stretch the thumb away from the hand.

Does my child need any tests to confirm the diagnosis?

It can be difficult to assess for congenital clasped thumb in the first three to four months of life as it can be normal for a child to grasp the thumb in the palm until then. Usually, diagnosis is confirmed through a simple assessment by the consultant, who may arrange for an x-ray of the hand, although this is not always needed.

What treatments are available?

Hand therapy is normally the first line of treatment. If no improvement is seen with hand therapy interventions, then surgery may be considered.

Hand therapy involves massage, stretches and potentially your child wearing a splint that is moulded to the hand and thumb to stretch the thumb out straight.

Massage

Before stretching the thumb out straight, it can be helpful to massage the joints and tissues around the thumb to warm them. Use a moisturising cream (such as aqueous cream) and rub it into the skin. Your therapist will show you where to massage on the thumb.

Use a firm pressure to massage but not so firm that it is painful for your child. You should never break or harm the skin itself with the massage.

Try to complete this _____ times a day for _____ minutes.

Stretches

After massage it can be helpful to use your own hand to stretch the affected thumb(s) out straight on your child. Try to hold the stretch for up to 30 seconds, as tolerated by your child.

The stretches should not be painful for your child, therefore do not worry if you cannot stretch the thumb out fully straight away. The combination of massage and stretches will gradually loosen tight structures over time.

Splint

A splint (supporting device) may be made for your child using a mouldable plastic to hold the affected thumb(s) out straight. This will be custom-made for your child and will need regular reviews to ensure it is fitting well as your child grows.

The best results are seen when splinting starts before your child is six months old. The splint should be worn full-time for between three and six months, removing only for hygiene, massage and stretches.

It is important that you do not get the splint hot or wet. If you notice any signs of the splint causing discomfort for you / your child, such as areas of tightness or rubbing, then please contact your hand therapist as soon as possible so that it can be reviewed / adjusted.

Surgery

If there is no improvement with massage, stretches and splinting over a three to six month period, then surgery may be suggested.

Your consultant plastic surgeon will discuss the options of surgery, including the risks and benefits of choosing to go ahead with an operation.

What happens if my child does not get treatment?

Without treatment, the thumb may become stiff in a bent position meaning your child will not be able to use the thumb in day-to-day use. Early assessment and starting of treatment can promote the best results for your child.

Thank you.

Additional services

Patient Advice and Liaison Service (PALS)

PALS can offer you advice and information when you have comments or concerns about our services or care. You can contact the PALS team on the advisory telephone line Monday, Tuesday, Thursday and Friday from 2pm to 5pm.

A Walk-in service is available:

Monday, Tuesday and Thursday between 10am and 4pm

Friday between 10am and 2pm.

The Walk-in and Advisory telephone services are closed on Wednesdays.
Please contact PALS in advance to check if there are any changes to opening times.

PALS is based within the hospital in the ground floor main corridor between Grosvenor and Lanesborough wings.
